Hot Mix Placement

Opportunity is missed by most people because it is dressed in overalls and looks like work.— Thomas Edison

 - Tractor
 - Screed
- Paving Procedures
 - Longitudinal joints
 - Compaction

www.asphaltinstitute.org

Surface Preparation

asphalt institute

www.asphaltinstitute.org

Surface Preparation

asphalt institute

- Often doesn't get due consideration
- It is often time consuming and labor intensive
- Asphalt layers cover up the potential problems
- THE PROBLEMS WE DO NOT TAKE CARE OF TODAY WILL NOT GO AWAY
 - Often the problems get worse
 - They are more costly to fix the second time

www.asphaltinstitute.org

Surface Preparation

asphalt institute

The most common surfaces overlaid with HMA or WMA include:

- Subgrade
- Granular Base Course (Aggregate Base)
- Existing Asphalt Pavement
- Existing PC Concrete Pavement

www.asphaltinstitute.org

Subgrade Preparation

asphalt institute

- The subgrade is the pavement foundation
- Must support the pavement, anticipated traffic, and construction equipment
 - Soil type considered in thickness design
- Must be properly graded to provide drainage
 - Transverse and longitudinal grade
 - Smoothness and cross slope
- Must be uniformly compacted to required density

www.asphaltinstitute.org

Aggregate Base Preparation

asphalt institute

- Mix to proper moisture content
- Best Practice - place using a laydown machine
- Place in 4" - 8" compacted lifts
- Stagger longitudinal and transverse joints at least one foot in each succeeding layer
- Compact base to percentage of proctor specified
- Cure before applying Prime Coat

www.asphaltinstitute.org

Prime Coat

asphalt institute

Why do we use Prime Coat?

- To seal in the subgrade at the proper moisture content
- To fill the surface voids and protect from the weather
- To stabilize the surface fines
- To promote bonding to the subsequent pavement layer

www.asphaltinstitute.org

Preparing to Overlay Existing HMA
asphalt institute

Preparing an existing asphalt surface may be as simple as sweeping (*multiple passes may be necessary*) the existing surface and applying tack coat

www.asphaltinstitute.org

Preparing to Overlay Existing HMA
asphalt institute

Or it may involve one or more of the following:

- Patching
- Cleaning and filling cracks
- Placing a leveling course
- Milling the surface

Failed areas MUST be cleaned, repaired and brought into good structural condition before overlaying.

www.asphaltinstitute.org

Tack Coat

asphalt institute

Why do we use Tack Coat?

- To promote the bond between old and new pavement layers.
- To prevent slippage between pavement layers
- To provide an additional moisture barrier, especially when applied along the transverse and longitudinal vertical surfaces

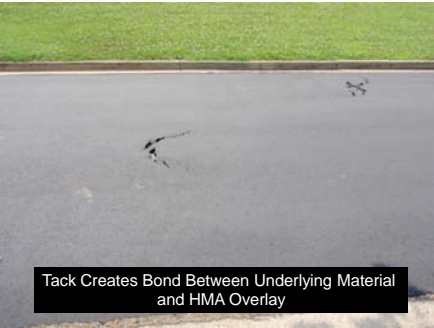

www.asphaltinstitute.org

Tack Coat

asphalt institute

Tack Creates Bond Between Underlying Material and HMA Overlay

www.asphaltinstitute.org

HMA Placement

asphalt institute

4 IN.

SINGLE COVERAGE

DOUBLE COVERAGE

TRIPLE COVERAGE

NOZZLE ANGLE SETTING: 15 TO 30 DEGREES

SPRAY BAR AXIS

www.asphaltinstitute.org

Patching

asphalt institute

- Make sure to get well into the sound pavement when you mark the patch for removal
- Use good straight lines that are cut with vertical faces
- Remove all loose material
- Tack base and all vertical surfaces
- Patches must be strong enough to become a part of the permanent structure or they will be back!

www.asphaltinstitute.org

Patching

Look for local pictures asphalt institute

Irregular patch - getting proper compaction is going to be difficult on this one.

Nice straight lines, no distress visible outside the patched area

www.asphaltinstitute.org

Preparing to Overlay Existing PCC

asphalt institute

- Full depth replacement of distressed slabs
 - Asphalt or PCC patch
 - Correct problems in base/subgrade
- Spalled joints repaired partial depth
 - Use PCC for patching
- Stabilize rocking slabs
- Replace joint sealer as required
- Clean and tack surface

Above precautions often don't work long-term

www.asphaltinstitute.org

Preparing to Overlay Existing PCC

asphalt institute

A better way to handle PCC pavement which needs to be overlaid is through one of the following techniques:

- Cracking and Seating
- Breaking and Seating
- Rubblization

These techniques reduce the size subject to movement, which makes them easier to permanently seat and stabilize.

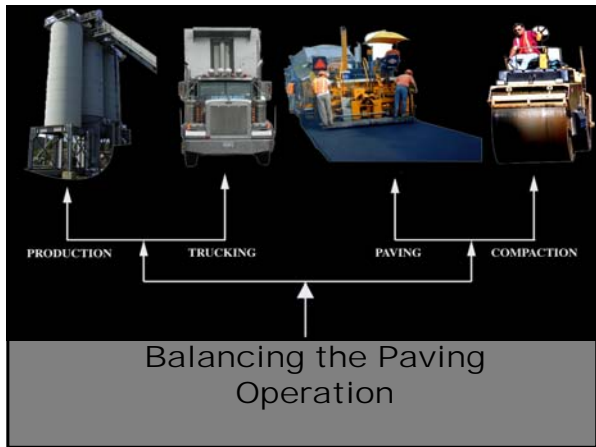

www.asphaltinstitute.org

asphalt institute

Hauling

www.asphaltinstitute.org

asphalt institute

Trucking

- How Many?
 - Need enough for uninterrupted paving
 - Don't want trucks waiting too long at paver or hot plant

www.asphaltinstitute.org

Trucking

asphalt institute

- Trucking Goals
 - Consistent delivery
 - Get in and out of paver smoothly
 - Consistent cycling
 - Uniform delivery
 - Uniform speed

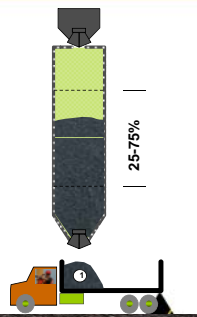

www.asphaltinstitute.org

Truck Loading

asphalt institute

- Use multiple drops
- Loading sequence:
 - Front

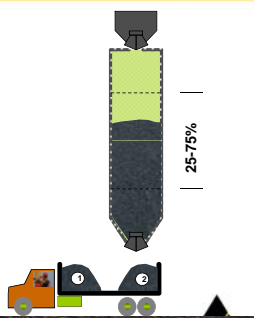

25-75%

Truck Loading

asphalt institute

- Use multiple drops
- Loading sequence:
 - Front
 - Back

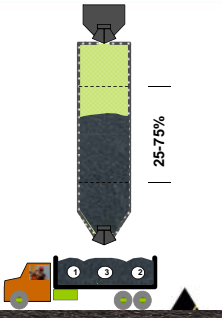

25-75%

Truck Loading

asphalt institute

- Use multiple drops
- Loading sequence:
 - Front
 - Back
 - Middle
- Always transfer HMA in “bulk”

Haul Trucks

asphalt institute

- Clean, smooth beds
 - Approved release agent
 - No diesel!
- Insulated & tarped
 - Front, sides, bottom
 - Thin overlays, long hauls, cold weather

HMA Delivery

asphalt institute

Trucks

- Coordinate delivery schedule
 - Maintain steady supply of material
 - Number, capacity, distance
- Break load before opening tailgate

asphalt institute

Don't Bump the Paver!

www.asphaltinstitute.org

The image is a slide from a presentation. It features the logo for 'asphalt institute' at the top. Below the logo is a cartoon illustration of a yellow paver machine and a blue dump truck. A red box highlights the text 'Don't Bump the Paver!' in a stylized font. At the bottom of the slide, the website address 'www.asphaltinstitute.org' is displayed.

HMA Placement

asphalt institute

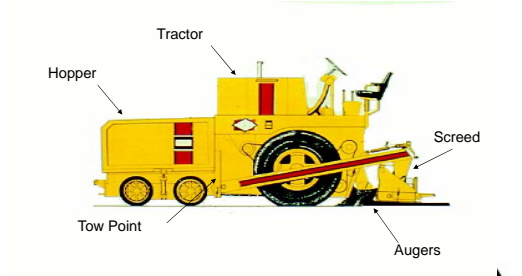

- Role of the paver is to meet specifications for grade, texture & smoothness

- Strike-off
- Crown control
- Extensions and End plates
- Thickness control screws
- Screed arm
- Pre-compaction system
- Heating systems
- Maintenance

www.asphaltinstitute.org

Paving Speed

asphalt institute

- Consistency, Consistency, Consistency
 - Run non-stop
 - Constant speed – all day
 - Speed increases – depth decreases
 - Speed decreases – depth increased

Why? Change the speed, and you change the balance of the forces.

www.asphaltinstitute.org

Screed Operation

asphalt institute

- Balance the Forces Acting on Screed
 - Speed of paver
 - Head of material
 - Angle of attack
 - Screed weight
- Pre-compaction

www.asphaltinstitute.org

Screed Reaction Time

asphalt institute

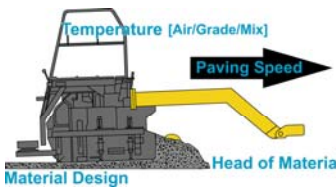

- Changes to settings or in speed require time to be fully accomplished.
- Generally 3 to 5 tow lengths. (50 to 80 yds.)

www.asphaltinstitute.org

Understanding the Paver

asphalt institute

Factors Affecting the Screed

- Paving speed
- Head of material
- Screed adjustments
- Mix design
- Mix temperature
- Air temperature
- Grade temperature

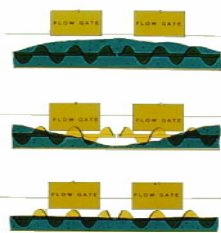

Courtesy: Caterpillar Global Paving

www.asphaltinstitute.org

Augers

asphalt institute

Gates too High – Augers overloaded

Gates too Low – Not enough material

Proper adjustment – Good material flow

www.asphaltinstitute.org

Starting Blocks

asphalt institute

Rule of thumb is to raise the screed 25 percent more than the compacted lift thickness

The diagram shows a perspective view of a grey screed with three wooden starting blocks on top. A vertical line indicates the screed's height, and a horizontal line indicates the compacted lift thickness. The screed height is visibly higher than the lift thickness.

www.asphaltinstitute.org

Vibrating Screed

The illustration shows a cross-section of a vibrating screed. A yellow vibratory plate is positioned above a grey screed. A circular vibrator is shown with red arrows indicating its rotation. The screed is shown in a dark green color.

www.asphaltinstitute.org

Head of Material

asphalt institute

- The paving material that lies in front of and spans the entire screed.
- **95 to 98 percent of all mat flaws originate with an improper head of material.**

www.asphaltinstitute.org
